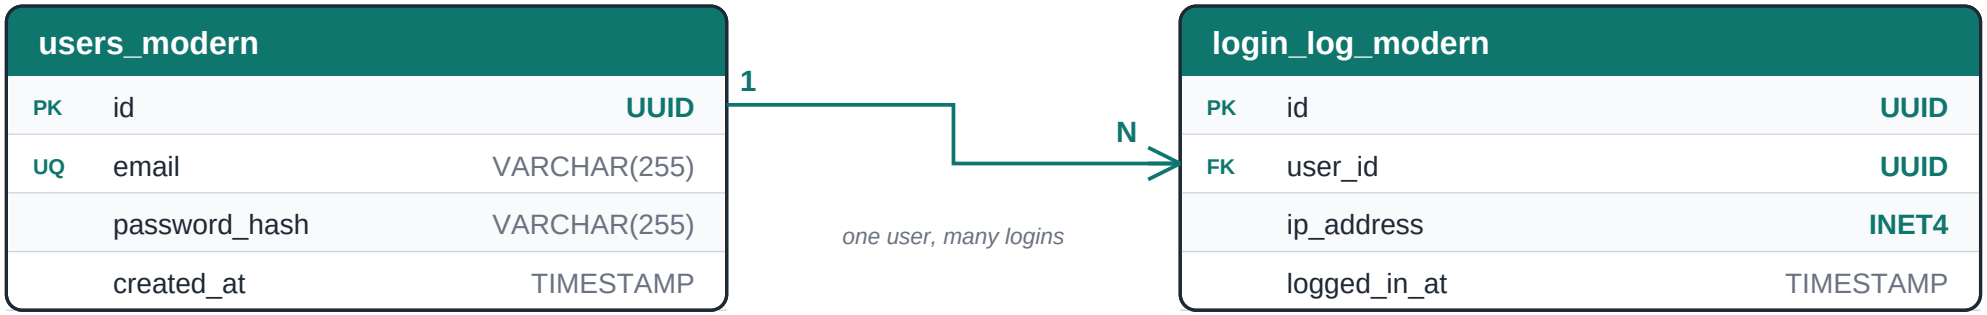
Database schema: modern vs baseline

Team Data Titans (Aya Hassen, Aziz Ben Othman) | Area 1: SQL that saves you work | MariaDB 13.0.2

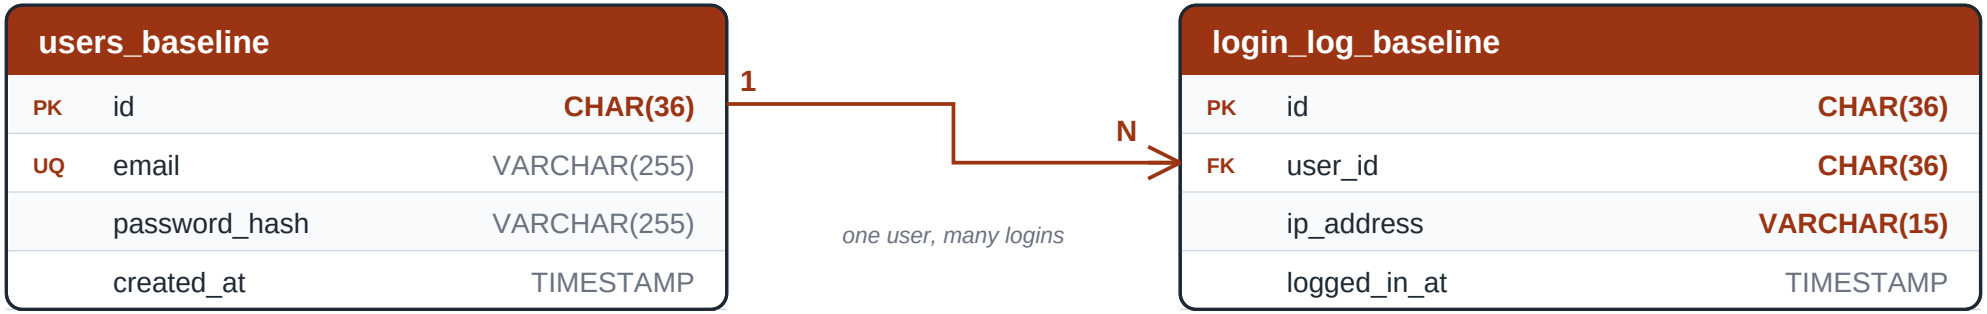
Modern version

Aya: uses UUID and INET4



Baseline version

Aziz: same structure, older types



What differs (bold colored types above)

id and user_id: UUID (16 bytes) vs CHAR(36) (36 bytes of text)
ip_address: INET4 (4 bytes, sorts numerically) vs VARCHAR(15) (text, sorts alphabetically)
Everything else is identical, so any measured difference comes from the types and the statements used.

PK = primary key FK = foreign key (user_id points to the id of its own users table) UQ = unique Crow's foot = many
